CYTECARE – FIGHTING CANCER THE RIGHT WAY.

There are many ways to treat cancer. And there is the right way. At Cytecure, we have a dedicated multi-disciplinary medical team merging evidence-based protocols and targeted therapies with advanced technologies for greater precision and better treatment. We have cancer specialists for every organ who are specialised in understanding the unique diagnosis of each particular organ. Their extensive knowledge of each organ site combined with state-of-the-art technologies and advanced treatment options, combat the disease at every stage more accurately. Our multi-disciplinary team of doctors analyse every stage of the disease and help patients stay strong during the course of the treatment.

**IF YOU LOVE SOMEONE,
HAVE THEM SCREENED
EARLIER, NOT LATER.**

CYTESCREEN

Cytecure Cancer Hospitals, Airport Road, Near Bagalur Cross, Yelahanka, Bengaluru - 560064

1. I'M HEALTHY. WHY SHOULD I GET MYSELF SCREENED?

Cancer doesn't discriminate. It affects people of all ages, nationalities and genders. Many people ignore symptoms until it is too late, worsening their chances of early detection and a good prognosis.

3. WHY IS SCREENING HELPFUL IN BEATING CANCER?

While there is no definitive way to prevent cancer, there are some things a person can do to improve their chances against fighting the disease. Screening for the disease is still one of the best ways to make an early diagnosis. When people have a family history or risk factors associated with the disease, lifestyle changes like quitting smoking, reducing stress etc. can help. Not all cancers have obvious symptoms and are caught early only with the help of screening.

5. WHAT ARE SOME OF THE RISK FACTORS FOR CANCER?

While it isn't always easy to pinpoint a source for the disease, research has shown that certain risk factors may increase a person's chances of developing cancer. Here are some of the risk factors:

- ◆ Age
- ◆ Cancer-causing substances
- ◆ Diet
- ◆ Immunosuppression
- ◆ Obesity
- ◆ Excessive exposure to sunlight
- ◆ Alcohol
- ◆ Chronic inflammation
- ◆ Hormonal causes
- ◆ Certain Infections
- ◆ Radiation
- ◆ Tobacco

2. SOMEONE IN MY FAMILY HAS HAD CANCER. AM I AT RISK?

While only 10% cancer is known to be passed on from one generation to the other, but if a family member has been afflicted by the disease, the odds of you being affected by it may increase. But don't worry; if you get yourself screened regularly and take precautions, the odds are stacked in your favour.

4. ISN'T SCREENING A DIAGNOSIS?

A lot of people associate screening with diagnosis but rather, it is like a preventive health check-up for cancer. It is series of specialised checks to help in the early detection of the disease and if need be, making lifestyle changes that can lower the risk.

6. HOW DOES AN EARLY DIAGNOSIS EVEN MATTER, DON'T I STILL HAVE TO GET TREATED?

The majority of malignant tumours can be treated successfully if detected early. Timely diagnosis of some cancers can help minimise the treatment required, associated costs and side effects. It makes it possible to limit the treatment to a relatively small procedure, thereby preserving the affected organ and preventing side effects of systemic treatment.

8. CYTESCREEN - GET SCREENED BY THE BEST.

Introducing Cytescreen, a cancer screening test devised by our team of senior oncologists. There are separate packages for men and women which help with early diagnosis as well as offer lifestyle recommendations.

9. COMPREHENSIVE PACKAGES.

CYTESCREEN PACKAGES	PACKAGE PRICE

For Couple Cytescreen Plus	INR 11,000
For Couple Cytescreen Standard	INR 6,500

Package price is 50% less than actual price.

7. WHAT DO YOU MEAN BY SCREENING TESTS?

Screening tests are a series of tests designed to help people identify the increased risk for a condition or disease before onset of symptoms so that preventive measures can be taken.

Screening tests include the following:

- Physical exam and history: An exam of the body to check general signs of health, including checking for signs of disease, such as lumps or anything else that seems unusual. A history of the patient's health habits and past illnesses and treatments will also be taken.
- Laboratory tests: Medical procedures that test samples of tissue, blood, urine, or other substances in the body.
- Imaging procedures: Procedures that make pictures of areas inside the body.
- Genetic tests: Tests that look for certain gene mutations (changes) that are linked to some types of cancer.
